DETAILED ACTION

This Office Action is in response to an Amendment filed on 7/21/2005.

Currently, claims 1-19 are pending.

Claim Objections

Claim Objections have been withdrawn.

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 2. Claims 1, 5 and 7 are rejected under 35 U.S.C. 102(b) as being anticipated by Doshi et al. (U.S. Patent No. 6,277,720 dated 8/21/2001).

Doshi shows the method as claimed in Figs. 1-11 and corresponding text as: depositing a nitride film (30) along a surface (col. 8, lines 8-22) of the substrate (2) and the gate stack (10) (col. 7, lines 51-65), wherein the nitride film is thicker over a surface of the substrate and thinner over a portion of the gate stack (col. 8, lines 8-22) (claim 1). Doshi teaches that the nitride film is non-conformal nitride film (col. 8, lines 8-22) (claim

- 5). Doshi teaches that the deposition of the nitride film provides enhanced stress within a transistor channel (col. 8, lines 8-22) (claim 7).
- 3. Claims 8-14 are rejected under 35 U.S.C. 102(b) as being anticipated by Becker (U.S. Patent No. 6,153,501 dated 11/28/2000).

Application/Control Number: 10/707,842 Page 3

Art Unit: 2812

Becker shows the method as claimed in Figs. 5 and 6 and corresponding text as: depositing a layer of nitride film (62A) over a gate stack (52A, will represent the stack) and a surface of a substrate (50) (col. 2, lines 44-62); removing the nitride film on the gate stack to provide enhanced stress in a transistor channel under the gate stack (col. 3. lines 8-16) (claim 8). Becker teaches that a resist material (64) is deposited on a surface of the nitride film over the substrate while leaving a surface of the nitride film proximate an upper portion of the gate stack (col. 3, lines 8-16) (claim 9). Becker teaches the removal of an upper portion of the gate stack and the nitride film disposed thereon (col. 3, lines 17-25) (claim 10). Becker teaches that depositing the resist comprises depositing one of a spin-on material, an anti-reflection coating, an oxide film, and a low k material (col. 3, lines 8-16) (claim 11). Becker teaches that spacers are formed at a lower portion of the sidewalls of the gate stack (col. 3, lines 8-16) (claim 12). Becker teaches that the spacers are formed includes forming the spacers along substantially all of the sidewall and etching the spacers to form spacers at the lower portion of the sidewalls (col. 3, lines 8-16) (claim 13). Becker teaches that depositing a resist comprises depositing at least one of an oxide layer or a borophosphorsilicate glass on low spots and leaving high spots exposed (col. 3, lines 8-16) (claim 14).

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Application/Control Number: 10/707,842

Page 4

Art Unit: 2812

5. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 6. Claims 2-4 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Doshi et al. (U.S. Patent No. 6,277,720 dated 8/21/2001) in view of Pan et al. (U.S. Patent No. 6,198,144 dated 3/6/2001).

Doshi shows the method substantially as claimed in the preceding paragraph.

Doshi lacks anticipation only in not explicitly teaching that: 1) a spacer is formed adjacent only a lower portion of the gate stack (claim 2); 2) forming the spacer comprises reducing a size of the spacer (claim 3); 3) reducing the spacer comprises reactive ion etching (claim 4); and 4) depositing the nitride film comprises a plasma enhanced vapor deposition process (claim 6)

Pan shows the formation of spacers that only cover lower portions of the gate stack and that a nitride film is deposited by (PECVD). Layer 20 is formed over the substrate and gate stack and is then etched to form spacers covering only a lower portion of the gate stack (col. 5, lines 21-32). Layer 22 is then formed over the substrate and gate stack, this layer is formed by PECVD, it can then be reduced and etch by reactive ion etching techniques (col. 5, lines 33-51). The advantages of these techniques aids in providing thicker portions on the horizontal portions (substrate) and

Art Unit: 2812

thinner on vertical surfaces (gate stack) (col. 2, lines 54-64). Another advantage is the fact that the nitride film reduces the conversion of conductive layers into non – conductive layers (col. 3, lines 16-32).

- It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to modify the method of Doshi by forming a spacer along the lower portions and forming a nitride by PECVD, as taught by Pan with the motivation that Pan teaches that thicker portions of deposited layers are formed on horizontal portions while thinner portions are formed on vertical portions and the nitride film reduces the conversion of conductive layers into non-conductive layers.
- 7. Claims 15 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Becker (U.S. Patent No. 6,153,501 dated 11/28/2000) in view of Pan et al. (U.S. Patent No. 6,198,144 dated 3/6/2001).

Becker shows the method substantially as claimed in the preceding paragraph.

Becker lacks anticipation only in not explicitly teaching that: 1) removing a portion of the gate stack and the nitride film disposed thereon comprises reactive ion etching (claim 15); and 2) removing a portion of the gate stack and the nitride film disposed thereon comprises chemical mechanical polishing (claim 16).

Pan shows the formation of spacers that only cover lower portions of the gate stack and that a nitride film is deposited by (PECVD). Layer 22 is then formed over the substrate and gate stack, this layer is formed by PECVD, it can then be reduced and etch by reactive ion etching techniques (col. 5, lines 33-51). The advantages of these techniques aids in providing thicker portions on the horizontal portions (substrate) and

Application/Control Number: 10/707,842

Art Unit: 2812

thinner on vertical surfaces (gate stack) (col. 2, lines 54-64). Another advantage is the fact that the nitride film reduces the conversion of conductive layers into non – conductive layers (col. 3, lines 16-32). Chemical mechanical polishing is well known and often used in etching nitride films.

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to modify the method of Becker by etching a nitride film by reactive ion etching and chemical mechanical polishing, as taught by Pan with the motivation that Pan teaches that thicker portions of deposited layers are formed on horizontal portions while thinner portions are formed on vertical portions and the nitride film reduces the conversion of conductive layers into non-conductive layers.

Response to Arguments

8. Applicant's arguments filed on 7/21/2005 in Application No. 10/707,842 have been fully considered but they are not persuasive. The examiner views the teaching of Doshi towards forming a good barrier with minimum thickness that lays in the range of 65 - 250Å teaches that the thicker portions of the nitride layer would be formed over the portions that need the most protection and thinner over those portions such as the gate stack which do not. The examiner views Becker as performing the same operation of removing a nitride layer, as the claimed invention.

Allowable Subject Matter

9. Claims 17 is allowed.

Page 7

Application/Control Number: 10/707,842

Art Unit: 2812

- 10. Claims 18-19 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
- 11. The following is a statement of reasons for the indication of allowable subject matter: the prior art, either singly or in combination fails to anticipate or render obvious, the limitations of:

...forming a spacer adjacent a sidewall of the gate stack; and etching upper portions of the spacer to form sidewalls only at lower portions of the gate stack, as required by claim 17.

Conclusion

12. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
